

- a) How big is the American app loan market. Who are your rivals. How is your product different from rivals.
- b) So much financial data will flow into the system. How will you ensure data security? Also, connecting consumer data with third-party/bank APIs require extra security under America's Consumer Financial Protection Bureau's open banking rule Section 1033. The financial API should be integrated under 1033-compliant aggregator standards.
- c) Your architecture is okay. Present the AI intelligence layer in a 1 row 5 column array. The fraud detection module should come first.
- d) The financial API must have credit score integration from some American Credit rating organization (Experian, TransUnion, Equifax)
- e) Integrate a bias testing module at the loan approval module stage
- f) Revenue Model:
 - i) Charge banks a commission for every successfully closed loan
 - ii) Licence your loan approval model, recommendation model and your explainable AI model as a separate SaaS service to smaller NBFCs and banks. They may not have the skills to access loan quality
 - iii) Basic tiers to users will have to be free. You can offer premium service in terms of faster loan processing, rate monitoring etc
 - iv) Cross sell credit cards, insurance services and other financial services from the app
